The concept of the proposed architecture allows for the creation of a system that integrates the advantages of both cloud computing and edge computing. The system is designed to be scalable and flexible, accommodating the needs of various industries and applications. It leverages the strengths of cloud computing for storage and processing, while utilizing edge computing for real-time data processing and decision-making.

The system consists of three main components: the cloud layer, the edge layer, and the integration layer. The cloud layer provides the necessary computing and storage resources, while the edge layer processes data closer to the source to reduce latency and improve response time. The integration layer facilitates the seamless communication and data exchange between the cloud and edge layers.

This architecture is particularly suitable for scenarios where real-time data processing is critical, such as in the healthcare industry for remote patient monitoring, or in the transportation sector for predictive maintenance. The system's scalability allows it to be adapted to different use cases, ensuring that it remains effective and efficient regardless of the scale of operation.
the woman with black hair.

11
It is practically unknown for the man who, as the result of a successful experiment, has discovered a new principle of science, to be able to give a clear and precise account of how he arrived at his discovery. The process is often obscure and confused, and it is difficult to reproduce the mental pathway that led to the discovery. The words of the inventor are often full of obscure and disconnected thoughts, and it is not easy to make sense of them. It is as if the mind were working in a labyrinth, and the inventor was only able to point to the exit, but not to show how he arrived at it.

In explaining a new discovery, the inventor often speaks in a language that is foreign to the mind of the hearer. The words are often connected by obscure and disconnected thoughts, and it is difficult to make sense of them. It is as if the mind were working in a labyrinth, and the inventor was only able to point to the exit, but not to show how he arrived at it.
