

Sea Level Rise is a Coast's Demise

Sea level rise is the increase in the level of the world's oceans. This rise is expected to reach **3.2 ft** by 2100.

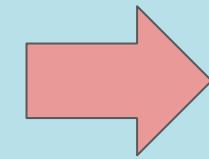

This rise is caused by **climate change**, which has led to ice cap and glacial melting.

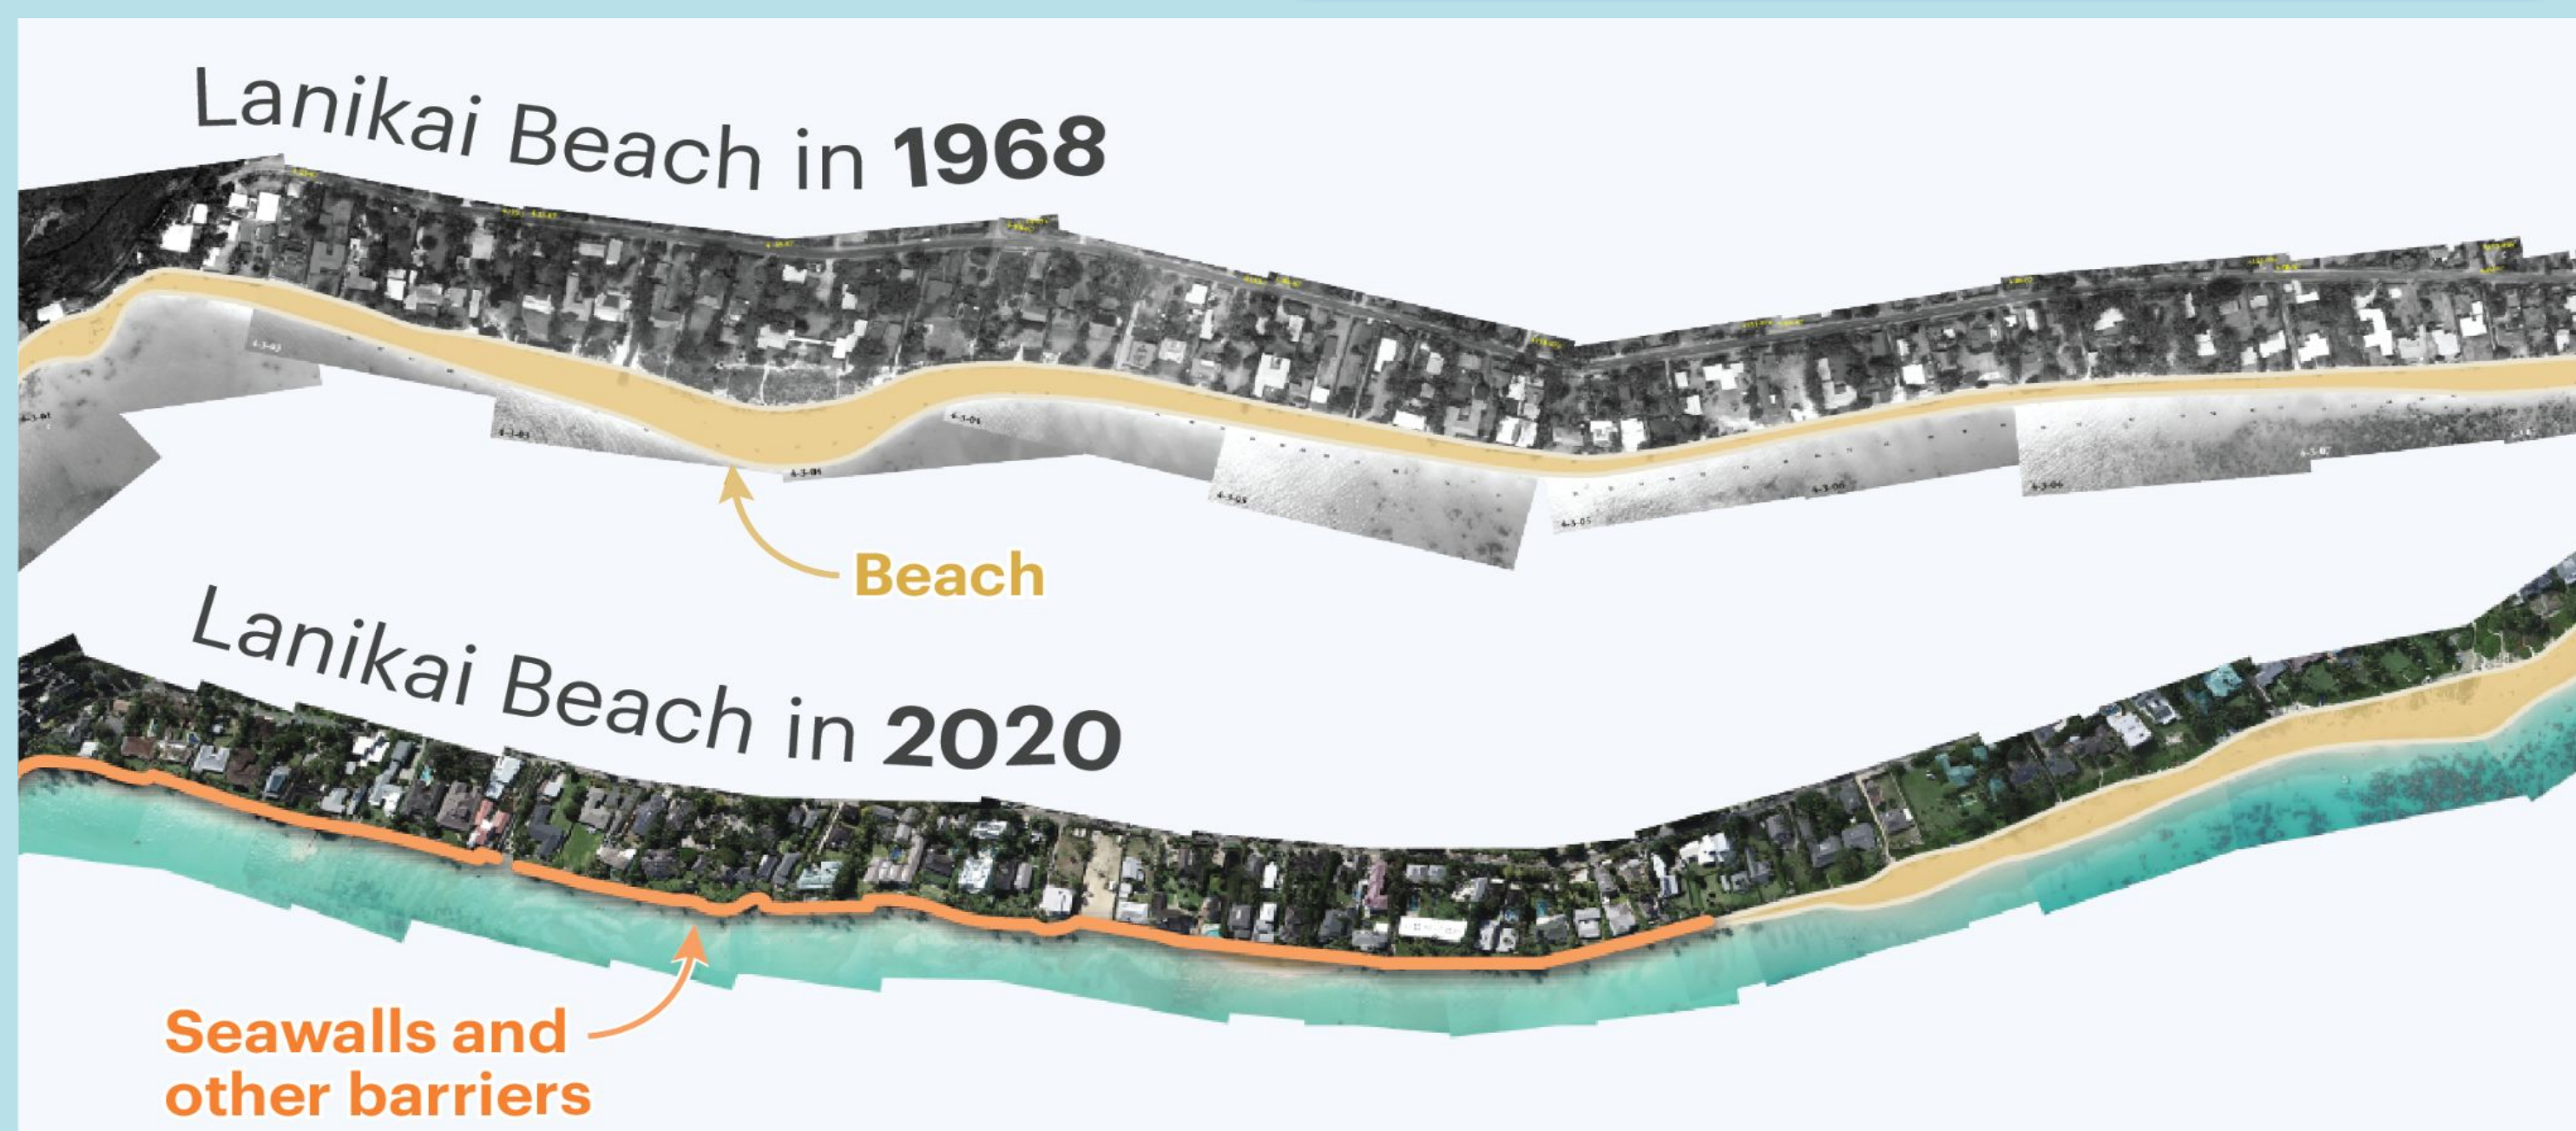

The rising sea levels and monster tides have caused erosion in coastal communities.

Coastal communities build sea walls to protect their property

The process of coastal erosion is sped up as the waves hit the seawalls and pull the sediment back with more force

Oahu has **lost 25%** of its beaches and over **70%** of other beaches have been affected by coastal erosion
